## Authors Information

<b>Titel</b>
--------------

Gaze Gesture-Based Human Robot Interface

A Multimodal Human-Robot-Interaction Scenario: Working Together with an Industrial Robot

Development of a wheelchair-based rehabilitation robotic system (KARES II) with various human-robot interaction interfaces for the disabled

Integration of a Rehabilitation Robotic System (KARES II) with Human-Friendly Man-Machine Interaction Units

Multimodal Control Architecture for Assistive Robotics

Proof of Concept of an Assistive Robotic Arm Control Using Artificial Stereovision and Eye-Tracking

Hybrid Manual and Gaze-Based Interaction With a Robotic Arm

Human-Machine Interface for Controlling a Light Robotic Arm by Persons with Special Needs

Gaze-based teleprosthetic enables intuitive continuous control of complex robot arm use: Writing & drawing

An EEG-/EOG-Based Hybrid Brain-Computer Interface: Application on Controlling an Integrated Wheelchair Robotic Arm System

Anticipatory robot control for efficient human-robot collaboration

Interface based on electrooculography for velocity control of a robot arm

Intelligent Multimodal Framework for Human Assistive Robotics Based on Computer Vision Algorithms

Symmetric Evaluation of Multimodal Human–Robot Interaction with Gaze and Standard Control

Electro-Oculogram Based Interactive Robotic Arm Interface for Partially Paralytic Patients

A Human-Robot Interface Using Eye-Gaze Tracking System for People with Motor Disabilities

3-D-Gaze-Based Robotic Grasping Through Mimicking Human Visuomotor Function for People With Motion Impairments

Demonstration of a semi-autonomous hybrid brain-machine interface using human intracranial EEG, eye tracking, and computer vision to control a robotic upper limb prosthetic

On the feasibility of using motor imagery EEG-based brain-computer interface in chronic tetraplegics for assistive robotic arm control: a clinical test and long-term post-trial follow-up

Indirect Robot Manipulation using Eye Gazing and Head Movement For Future of Work in Mixed Reality

A Custom EOG-Based HMI Using Neural Network Modeling to Real-Time for the Trajectory Tracking of a Manipulator Robot

Rotation Matrix to Operate a Robot Manipulator for 2D Analog Tracking Objects Using Electrooculography

Affine transform to reform pixel coordinates of EOG signals for controlling robot manipulators using gaze motions

Human–Robot Interaction through Eye Tracking for Artistic Drawing

A novel robotic system for painting with eyes

Eye Gaze Controlled Robotic Arm for Persons with Severe Speech and Motor Impairment

Comparing Two Safe Distance Maintenance Algorithms for a Gaze-Controlled HRI Involving Users with SSMI

Performance Analysis of a Head and Eye Motion-Based Control Interface for Assistive Robots

Eye-Gaze Control of a Wheelchair Mounted 6DOF Assistive Robot for Activities of Daily Living

3D gaze Cursor: continuous calibration and end-point grasp control of robotic actuators

Wireless and Portable EOG-Based Interface for Assisting Disabled People

Continuous Shared Control for Robotic Arm Reaching Driven by a Hybrid Gaze-Brain Machine Interface

Hybrid gaze/EEG brain computer interface for robot arm control on a pick and place task

Using Visuomotor Tendencies to Increase Control Performance in Teleoperation

Towards Robust Robot Control in Cartesian Space Using an Infrastructureless Head- and Eye-Gaze Interface

Head-free, Human Gaze-driven Assistive Robotic System for Reaching and Grasping

A Human-Robot Interface using Vision-Based Eye Gaze estimation System

Closed-Loop Hybrid Gaze Brain-Machine Interface Based Robotic Arm Control with Augmented Reality Feedback

Human-robot Shared Control of Articulated Manipulator

---

Doi	Technology overview
-	Eye tracking controlling a collaborative robot.
<a href="https://doi.org/10.1007/978-3-319-46669-9_85">https://doi.org/10.1007/978-3-319-46669-9_85</a>	Eyetracking, Speech recognition and Touch screen are used to control an industrial robot, mobile platform and IoT.
<a href="https://doi.org/10.1109/AIM.2003.1225462">https://doi.org/10.1109/AIM.2003.1225462</a>	Eyetracking, EMG, haptic suit and a display are used to control a robot arm and a wheelchair. Further, mouth recognition is implemented for sensing readiness to drink.
<a href="https://doi.org/10.1023/B:AURO.0000016864.12513.77">https://doi.org/10.1023/B:AURO.0000016864.12513.77</a>	Eye tracking (eye-mouse), EMG, shoulder/head interface and a display are used to control a robot arm and a mobile platform. Further, face recognition is implemented.
<a href="http://dx.doi.org/10.1007/978-3-319-46669-9_85">http://dx.doi.org/10.1007/978-3-319-46669-9_85</a>	Eye tracking is used to control an assistive robotic arm. Objects were tracked by an MOTIVE system (Optitrack).
<a href="https://doi.org/10.1109/TNSRE.2019.2950619">https://doi.org/10.1109/TNSRE.2019.2950619</a>	Eye tracking is used to control an assistive robotic arm.
<a href="https://doi.org/10.1109/ETFA45728.2021.9613371">https://doi.org/10.1109/ETFA45728.2021.9613371</a>	Eye tracking and computer mouse are used to control an assistive robotic arm over a display.
<a href="http://dx.doi.org/10.1109/ICC51557.2021.9454664">http://dx.doi.org/10.1109/ICC51557.2021.9454664</a>	Eyetracking is used to control a collaborative robot and electric wheelchair over a display.
<a href="https://doi.org/10.1109/BIOROB.2016.7523807">https://doi.org/10.1109/BIOROB.2016.7523807</a>	Eye tracking is used to control a industrial robot arm. Head tracking is used to control the robot in the third direction (moving forward and backward).
<a href="https://doi.org/10.3389/fnins.2019.01243">https://doi.org/10.3389/fnins.2019.01243</a>	hBCI, EEG and EOG is used to control an assistive robot arm over a display. Cameras are used to realize a shared control.
<a href="https://doi.org/10.1109/HRI.2016.7451737">https://doi.org/10.1109/HRI.2016.7451737</a>	Eye tracking and speech recognition are used to control a robot arm.
<a href="https://doi.org/10.1080/11762322.2010.503107">https://doi.org/10.1080/11762322.2010.503107</a>	EOG is used to control a robot over a display.
<a href="https://doi.org/10.3390/s18082408">https://doi.org/10.3390/s18082408</a>	EEG and EOG are used to control an assistive robotic arm. Additionally head and mouth tracking is used to accomplish a drinking task.
<a href="https://doi.org/10.3390/sym10120680">https://doi.org/10.3390/sym10120680</a>	Eye tracking is used to control a research robot over a display.

-	EOG is used to control a robot.
-	Eye Tracking and Motion Tracking was used to control a robot.
<a href="https://doi.org/10.1109/TBME.2017.2677902">https://doi.org/10.1109/TBME.2017.2677902</a>	Eye tracking was used to control an assistive robotic arm.
<a href="https://doi.org/10.1109/tnsre.2013.2294685">https://doi.org/10.1109/tnsre.2013.2294685</a>	hybrid BCI (EEG/Eye tracking)
<a href="https://doi.org/10.1038/sc.2012.14">https://doi.org/10.1038/sc.2012.14</a>	EEG-BCI, head tracking and eye tracking were used to control an assistive robotic arm. Visual cues and feedback were given over a display.
<a href="https://doi.org/10.1109/VRW.2022.00107">https://doi.org/10.1109/VRW.2022.00107</a>	Augmented Reality Glasses were used to control an industrial robot.

**Task description**

Two columns were presented Two subtasks were executed. The user should control the robot to grasp the first cube from the first column and put it on the second column behind it (first subtask), then grasp the other cube from the third column and put it on the first one (second subtask).

No User Study was conducted.

No User Study was conducted.

The experiment tested the performance of the system in a drinking task.

No User Study was conducted.

No User Study was conducted.

The participants were asked to execute joint movements by using their gaze.

No User Study was conducted.

The task contained tele-writing or painting: Participants were asked to imagine writing a text with the pen and look where the pen would be going. They were asked to write letters as fast and as accurate as possible, with a given letter size template.

The study tested a self-drinking task. Participants were asked to move a wheelchair to a table (EEG), manipulating the robotic arm via EOG to grasp a bottle and drink with a straw, placing the bottle back and navigating back through multiple obstacles and a door.

Participants had to choose a smoothie out of 12 ingredients. The robot system has to anticipate the choices by the eye gaze and grasp the right item and place it in front of the user.

Moving the robot over certain targets.

The participants were asked to select three kinds of objects by gaze (a glass, a bottle, and a fork) wearing the Tobii Glasses.

Participants were asked to play chess in three different difficulties (number of moves, number of figures), and 3 different modalities (eye tracking, controller, multimodal (combined))

No User Study was conducted.

The participants were asked to push buttons by gazing on them, yet the study did represent a proof of concept. No descriptions on participants were given. Other tests with playing FreeCell.

2 staged grasping approach by fixating locations on the object. The evaluation was quantified from two aspects: 1) the success rate of the grasping task and 2) subjective evaluation using questionnaires.

Participants were asked to conduct a reach-grasp-and-drop task, with 3 different balls. It was shown in an objective measurement that up to 8 objects could be detected by the computer vision algorithm with eye tracking.

Participants were told to visually focus on a glass and activate the BCI system by performing the agreed-to 'grab' class (the first of the feedback class pair). After the robot grab action sequence was completed, they were instructed to place the glass back.

No User Study was conducted.

Experiment 1: Standard calibration with inexperienced and expert users,  
Experiment 2: Customized Calibration With Inexperienced Users

The participants were told to focus 20 different points on a display. The participants were told to fixate 24 visual markers. After training they conducted certain geometrical patterns to evaluate the mathematical model.

No User Study was conducted.

The participants were asked to draw with their eyes on basis of AI-generated pictures. The eye movements were interpreted in two ways. While focussing on a location the participant could paint a point, when saccades were performed a line was drawn.

Participants were asked to pick and drop a Badminton shuttlecock. In the first study the participants could bring the robotic arm at any random point within the field of reach of the robotic arm. In the second task directional arrows were given to move the robot.

The participant was asked to perform the task of reaching the designated target for a print on cloths twice. The target positions were randomized for each trial and participant.

The participants were asked to perform a button activation task to assess discrete control (event-based control) and a Fitts's Law task. The usability study was related to a use-case scenario with a collaborative robot assisting a drinking action.

Participants were asked to perform activities of daily living (ADL), which included picking objects from the upper shelf, pick an object from a table, picking an object from the ground.

Participants were told to execute a reaching and grasping task with the robot.

Participants were asked to perform trajectories between fixed visual markers by "drawing" these trajectories with their eyes.

Participants were asked to accomplish a reach task with eye tracking and BCI. In this study three paradigms were tested, which could be controlled by the participant: 1) The system with shared control both in speed and direction 2) with shared control in speed only 3) with shared control in direction only.

The Participants were asked to sort two objects colored red and blue in their individual colored spaces by using motor imagery to control the robot.

The task was described as picking up a tennis ball.

The participant randomly gazes at five different target points inside a robots working area for 20 min in total. The user blinks with the left eye to send the gaze point to the robot control pipeline upon which the robot moves to this point.

Experiment I: By fixating on the scissors, the robot would reach for it and bring it toward the user. Experiment II: By fixation on the scissors, the robot would reach the scissors and catch the scissors. Then plan the motion trajectory of the robotic arm through a series of fixations to avoid obstacles on the table and finally bring it to the user.

The user controlled the robot over a display in which he focused on buttons. The display was separated in squares to facilitate the evaluation.

For each online trial, the BMI user operates the robotic arm to transfer a cuboid to the target area in the same color while avoiding the virtual obstacle in the middle of the workspace.

Participants were asked to control a robot along a grid on which a given path was shown.

## Describing Parameters of the Empirical Study

Number of Participants	Number of Repetitions
10, of which 1 is diagnosed with multiple sclerosis and is paralyzed from the neck down.	-
-	-
-	-
6 impaired participants with C4/c5 lesions	-
-	-
-	-
7 participants	-
-	-
8 Subjects	5
22 participants in total, 5 participants in the self drinking task (robot manipulation)	3
26 participants	-
3 participants	-
10 participants	20
20 participants	3

-	-
-	-
-	>4
2 participants	28 and 31 regarding the task
9 chronic impaired participants	-
-	-
30 participants (experiment 1) and 30 participants (Experiment2)	20
3 participants	20
3 participants (operators)	-
-	-
-	-
Study 1: In total 18 participants (9 healthy, 9 impaired), Study 2: 12 (6 healthy, 6 impaired)	2 repetitions in each trial
13 participants (7 healthy, 6 disabled)	-
10 participants +1 ALS patient	3 Tests, each participant had to reach 33 correct trials.
10 participants	5 trials and 3 manipulation tasks
7 participants	-

6 participants	-
6 participants	3 paradigms each 10 trials
8 participants	-
5 participants	5
3 participants	10
5 participants	2 tests with each 5 trials
-	200 trials in total 30 trials: 15 with and 15 without feedback
8 participants	
4 participants	-

<b>Performed empirical Test</b>
Nasa TLX
-
-
Satisfaction degree in percent in form of a questionnaire
-
-
SUS
-
-
-
Questionnaire for perceived awareness and intentionality of the robot.
-
-
NASA TLX, together with 5 point Likert scale.

-

-

USE Questionnair

-

Empiric evaluation of the health status of each patient via sensory AIS score. Clinical Questionnaire about perception of the system.

-

-

-

-

-

-

-

-

NASA TLX (RTLX Version) and subjective questionnaire

Not standardized test

Measurements to cognitive load, not specified
